Subjective Analysis

Patient Self-Report

Patient continues to feel very frustrated that she feels like her ROM is not improving and she still has a lot of pain when trying to push it. Her surgeon had a heart attack so she isn't able to get back in to see him right now but she will see another MD in the same office tomorrow.

=====

HPI: The patient is a 55-year-old female who serves as a Director of Research and Development and is presenting for post-operative rehabilitation following a left total knee arthroplasty (L TKA) performed on October 27, 2025.

Outcomes Survey Results

Assessment

Patient Assessment / Diagnosis

Pt has attended a total of 9 visits and has met 3 functional long-term goals. The patient demonstrates moderate progress toward remaining goals, with improvements noted in strength and ROM. Current presentation indicates continued limitations in performing functional tasks such as ADLs and recreational activities. Based on clinical findings and patient response to interventions, skilled PT remains necessary to progress toward remaining goals, address residual deficits, and promote optimal functional independence.

PN 12/15: Barbara tolerated treatment session fairly well today. Objective measurements re-assessed today on her 17th visit. She has met 3 of her 6 long term goals. She has made good progress functionally. She still feels frustrated that she is working on her ROM so hard but still having pain. Her L knee ROM measures at 4-100 degrees which is really not behind for this stage post op (7 weeks since surgery). Her strength is measuring well also. Encouraging patient that she is not as behind as she thinks and discussed asking the doctor if there were other ways she could manage her pain/inflammation. She was working on HEP 4x/day but I told patient to back down to 2x/day. Barbara will continue to benefit from skilled PT intervention to address remaining impairments.

11/21: Ms. Kimmich has attended a total of 10 visits and has met 2 functional long-term goals. The patient demonstrates significant progress toward remaining goals, with improvements noted in strength, ROM and decrease pain levels. Current presentation indicates progressing tolerance in performing functional tasks such as ADLs, ambulation, recreational activities and house hold chores. Based on clinical findings and patient response to interventions, skilled PT remains necessary to progress toward remaining goals, address residual deficits, and promote optimal functional independence.

Pt presents with signs and symptoms consistent with diagnosis of: s/p L TKA (10/27/25)

Contraindications to Therapy

None.

Rehab Prognosis/Potential

Excellent

Goals

General Objective Analysis

Time Out: 6:03 pm
Total: 63 Minutes

Assessment

Patient Assessment / Diagnosis

Pt tolerated treatment session well today. Session focused heavily on knee ROM as she is 1 week from an MUA. Pt was able to perform all exercises without any compensatory effects and is demonstrating improved mobility. Flexion measures at 119 degrees today. Pt will continue to benefit from skilled PT intervention to address remaining impairments and return to PLOF.

PN 12/15: Barbara tolerated treatment session fairly well today. Objective measurements re-assessed today on her 17th visit. She has met 3 of her 6 long term goals. She has made good progress functionally. She still feels frustrated that she is working on her ROM so hard but still having pain. Her L knee ROM measures at 4-100 degrees which is really not behind for this stage post op (7 weeks since surgery). Her strength is measuring well also. Encouraging patient that she is not as behind as she thinks and discussed asking the doctor if there were other ways she could manage her pain/inflammation. She was working on HEP 4x/day but I told patient to back down to 2x/day. Barbara will continue to benefit from skilled PT intervention to address remaining impairments.
